

Linux Server Migration — Requirements Checklist

1Kosmos Revenue Intelligence Dashboard (AR / ARR / Pipeline)

Prepared: 2026-07-05
For: Client IT / Infrastructure Team

We are migrating the 1Kosmos dashboard application (Django backend + React frontend + PostgreSQL database) to a Linux server. To complete this migration without downtime or data-access issues, we need the following information and infrastructure changes confirmed by the client's IT/DBA team before cutover.

1 PostgreSQL Database — Access Details

Why we need this: the application connects directly to PostgreSQL using these credentials at startup (see DATABASES in Django settings). Without correct, current values the backend cannot start or reach existing data.

Database Host / Server IP	
Port currently in use	 (default PostgreSQL port is 5432 — confirm if different)
Database name	
Username	
Password	
Connection method	 (local socket / TCP-IP / SSL required Y-N)

2 PostgreSQL — Required Permissions

Please confirm which of the following operations the above user is (or will be) granted on this database. The application performs day-to-day reads/writes and, during setup, needs to run schema migrations.

- ☐ SELECT (read data)
- ☐ INSERT (add records)
- ☐ UPDATE (edit records)
- ☐ DELETE (remove records)
- ☐ CREATE (new tables/migrations)
- ☐ ALTER (schema changes/migrations)
- ☐ DROP (remove tables, if permitted)
- ☐ TRUNCATE
- ☐ CONNECT (login to database)
- ☐ USAGE on schema (e.g. public)

If full ownership of the database/schema is not possible, minimum required is SELECT, INSERT, UPDATE, DELETE, CREATE, ALTER, and CONNECT so the Django app can run and apply migrations.

3 Network / Firewall — Application Ports

Why we need this: the React frontend serves on port 3000 and the Django API serves on port 8000. Both ports need to be reachable (unblocked / unbound from any restrictive default) on the new Linux server for the application to be accessible.

3000

Frontend (React) — needs to be open for browser access

8000

Backend API (Django) — needs to be open for frontend ↔ backend calls

OS-level firewall	 (ufw / firewalld / iptables — confirm rule added for 3000 & 8000)
Cloud security group	 (if hosted on AWS/Azure/GCP — confirm inbound rule added for 3000 & 8000)
Reverse proxy / load balancer	 (if any Nginx/Apache in front — confirm routing rules)

.....
Client IT/DBA — Name & Signature

.....
Date

1Kosmos Dashboard — Server Migration Requirements · Please return this completed form to the project team before the scheduled migration date.
